

REMARKS

Claims 1, 3-20 remain in this application. Claim 2 has been cancelled without prejudice.

Independent claims 1, 16, 20 have been amended to particularly recite that the "buffering" takes place at the server, distinguishing the independent claims from Katseff. This amendment further addresses the Examiner's concern that the "Applicant's independent claim limitations do not specify where the buffering/synchronization takes place."

35 U.S.C. §102

Claims 1, 9, and 16 are rejected under 35 U.S.C. §102 as being anticipated by U.S. Patent No. 5,822,537 to Katseff et al (Katseff). Applicants respectfully traverse the rejection.

The claimed invention is directed to synchronizing asynchronous time-based and motion data by retrieving from a server frames of data that make up a time-based data stream and a motion data stream, variably buffering one of the two streams, and producing two streams with synchronized frames. The two streams with synchronized frames are played at a client, producing synchronized motion and time-based data. (See Specification, Page 2, lines 1-12). Synchronization of the data frames (data streams) takes place at a synchronizer prior to transmitting the synchronized data streams to a network, eliminating the need for the client to synchronize the data streams. (See Specification, page 9, lines 3-6 and Fig. 4)

Amended Claim 1, for example, recites a method of synchronizing asynchronous time-based and motion data in a system in which the time-based data and motion data are transmitted by a server over a network to a client, the method comprising:

1 retrieving a time-based data stream and a motion data stream at the
2 server, each stream comprising frames of data;

3 variably buffering one of the time-based data stream and the motion
4 stream at the server to produce two streams having synchronized frames;
5 and

6 using the synchronized frames at the client for playback of
7 synchronized motion and time-based data to a user.

8
9 The method of claim 1 is not disclosed by Katseff. Katseff shows a
10 multimedia system to record, store and distribute multimedia presentations
11 together with materials that may be referenced during the presentation (see
12 Abstract of Katseff). Katseff shows a continuous media and storage retrieval
13 system used for digitizing and compressing audio, video, and other continuous data
14 (Katseff at col. 5 lines 18-22). Katseff shows a digitizer/compressor that generates
15 a data stream that preferably is in JPEG file format. JPEG file format is preferred
16 because of the inherent synchronization of audio and video streams (Katseff at col.
17 6, lines 60-67 through col. 7, lines 1-7). Katseff further shows an information
18 retrieval system that allows a user to access multimedia information that has been
19 stored in a plurality of databases (Katseff at col. 8, lines 18-22). Katseff does not
20 disclose accessing of separate audio (time-based) and video (motion-based).

21 In Katseff, a workstation (client) retrieves several frames of audio and
22 video from a file server for storage in an audio buffer and a video buffer at
23 workstation. No buffering and synchronization is made as to the audio and video
24 frames at the server. Katseff discloses that it is preferred that the workstation (or
25 client) will have a mechanism to synchronize the presentation of the various

1 outputs (audio and video) (Katseff at col. 8, lines 60-65 through col. 9, lines 1-5).
2 Katseff does not disclose that audio and video frames be synchronized prior to
3 receipt at the workstation.

4 Claim 1 in part recites "retrieving a time-based data stream and a motion
5 data stream at the server, each stream comprising frames of data." Katseff does
6 not show this aspect.

7 The Examiner has interpreted this as "accessing of separate audio (time-
8 based) and video (motion-based) data." Para. 22 of OA. The Examiner argues
9 that a JPEG movie file interleaves a frame of audio and video (which can be
10 interpreted as a movie separated into separate audio and video component frames)
11 (Katseff column 6, lines 64-67). Applicant does not disagree with the Examiner's
12 definition of a JPEG movie file, however, Katseff discloses a single data stream.
13 That single data stream has interleaved frames of audio and video. In contrast,
14 claim 1 recites retrieving both a time-based data stream and a motion data stream
15 at the server. These are two distinct streams which are retrieved at the server.
16 Katseff does not disclose or teach that two distinct streams, time-based stream and
17 motion data stream, are retrieved from a server.

18 Since the JPEG movie file format is chosen for the "inherent
19 synchronization of the audio and video streams," the recited element of "variably
20 buffering one of the time-based data stream and the motion stream at the server to
21 produce two streams having synchronized frames" would not be needed and is not
22 disclosed or taught by Katseff, since the JPEG movie file format seems to address
23 the synchronization of the audio and video streams.

24 The Examiner notes that Katseff discloses "a method for relieving network
25 congestion by monitoring buffers' threshold and compensating by reducing video

1 transmittal rate, then reducing audio playback rate" (Katseff - title). The title of
2 Katseff discloses that "monitoring buffers' threshold" is to relieve network
3 congestion. Katseff does not disclose or teach buffering to produce two streams
4 with synchronized frames. While Katseff discloses use of audio and video buffers,
5 these buffers are located at the client and not at the server (Katseff, column 8, lines
6 60-67). Since Katseff uses an inherently synchronized file format, it does need
7 buffers at the server to "variably buffer the two streams at the server.

8 For these reasons, claim 1 is patentable over Katseff. Applicants
9 respectfully request that the §102 rejection of claim 1 be withdrawn.

10 **Dependent claim 9** is allowable by virtue of its dependency on base claim
11 1. For the reasons given above with respect to claim 1, the systems and methods
12 recited in claim 9 are neither disclosed nor taught by Katseff. Applicants
13 respectfully request that the §102 rejection of claim 9 be withdrawn.

14 **Amended Claim 16** recites an apparatus resident on a server for
15 synchronizing asynchronous time-based and motion data in a system in
16 which the time-based data and motion data are transmitted by the server
17 over a network to a client, the apparatus comprising:

18 a data retriever for retrieving a time-based data stream and a motion
19 data stream at the server, each of the streams comprising frames of data;

20 a data stream synchronizer for buffering one of the time-based data
21 stream and the motion stream to produce two streams having synchronized
22 frames; and

23 a packetizer for packaging synchronized frames of motion data and
24 time-based data for use at the client for playback of synchronized motion
25 and time-based data to a user.

1 As discussed above, Katseff does not disclose accessing of separate audio
2 (time-based) and video (motion-based) streams which are two distinct streams.
3 Katseff shows a workstation (client) that retrieves several frames of audio and
4 video from a file server for storage in an audio buffer and a video buffer. No
5 synchronization is made at the server as to the audio and video frames. Katseff
6 suggests that the workstation (client) have a mechanism that synchronizes the
7 presentation of the various outputs (audio and video) (Katseff at col. 8, lines 60-65
8 through col. 9, lines 1-5). Katseff does not disclose that audio and video frames be
9 synchronized (at the server) prior to receipt at the workstation. Katseff further
10 describes that audio and video frames be buffered at the workstation and that the
11 workstation include a mechanism for synchronization of audio and video frames
12 for playback.

13 Claim 16 in part recites "a data stream synchronizer for buffering one of the
14 time-based data stream and the motion stream to produce two streams having
15 synchronized frames." Katseff does not show this aspect. As discussed, Katseff
16 discloses buffering audio and video frames; however, Katseff does not disclose
17 that the frames are synchronized with one another by buffering one of the time-
18 based and motion stream, and in particular at the server. Further Katseff does not
19 disclose that two streams having synchronized frames are produced from the
20 buffering at the server.

21 Claim 16 in part recites "a packetizer for packaging synchronized frames of
22 motion data and time-based data for use at the client for playback of synchronized
23 motion and time-based data to a user." Katseff does not show this aspect. As
24 discussed above, Katseff does not disclose synchronized frames of motion and
25

1 time-based data. Therefore, Katseff would have no need to package such
2 "synchronize frames."

3 For these reasons, claim 16 is patentable over Katseff. Applicants
4 respectfully request that the §102 rejection of claim 16 be withdrawn.

5 **35 U.S.C. §103**

6 **Claims 2, 4, 12, 14, and 18**

7 Claims 2, 4, 12, 14, and 18 are rejected under 35 U.S.C. §103 as being
8 unpatentable over Katseff in view of Shibata, Y., Media Synchronization Protocols
9 for Packet Audio-Video Systems on Multimedia Information Networks (Shibata),
10 IEEE, January 3-6, 1995. Applicant respectfully traverses the rejection. Claim 2
11 has been canceled.

12 **Claims 4 and 12** depend from claim 1 and hence incorporate the features of
13 claim 1. As such claims 4, and 12 require "...retrieving a time-based data stream
14 and a motion data stream at the server, each stream comprising frames of data;
15 variably buffering one of the time-based data stream and the motion stream at the
16 server to produce two streams having synchronized frames; and using the
17 synchronized frames at the client for playback of synchronized motion and time-
18 based data to a user."

19 Katseff does not suggest nor teach retrieving both a time-based data stream
20 and motion data stream. Katseff shows retrieving single data streams such as a
21 JPEG data stream (Katseff col. 6, lines 60-65). Katseff does not suggest nor teach
22 synchronizing frames of the time-based data stream and the motion data stream at
23 a server to produce two streams of synchronized frames, by buffering one of the
24 data streams. Katseff discloses buffering, however, the buffering of audio and
25 video frames does not produce synchronized frames and takes place at a client

1 (Katseff at col. 8, lines 60-65). Katseff relies on a mechanism at the workstation
2 (client) to synchronize audio and video frames (Katseff at col. 9, lines 1-5). The
3 workstation (client) therefore never receives synchronized frames for playback.
4 The workstation is required to synchronized the frames with a built-in
5 synchronizing mechanism. Katseff does not suggest nor teach "using the
6 synchronized frames at the client for playback of synchronized motion and time-
7 based data to a user."

8 Examiner points out that Shibata teaches a rate control message that is sent
9 to a server. The rate controller described on page 596 of Shibata does not suggest
10 that data streams be variably buffered. Shibata's rate controller monitors a current
11 video frame rate with a set video frame rate value and adjusts the video frame rate
12 depending on the difference between the set video frame rate value and the current
13 video frame rate value. Further Shibata does not suggest that audio or time-based
14 rate values can be controlled. Shibata states that "since the audio segment rate is,
15 relatively, much smaller than that of the video, audio segments do not require rate
16 control ... [T]herefore, only the video frame rate is controlled. (Shibata at page
17 596).

18 Shibata provides no assistance in light of Katseff as to the recited
19 methodology of **claim 2**. Accordingly, a combination of Katseff and Shibata fails
20 to teach or suggest the claimed methods. Applicants respectfully request that the
21 §103 rejection of claims 2 be withdrawn.

22 **Claim 4** further adds "transferring only those data values for a frame that
23 have changed since a last frame was transmitted." Frames are synchronized prior
24 to transferring of data values. In other words, a time-based frame is synchronized
25 with a motion frame; time based and motion based frames are sent with one

1 another. If no change occurs, the frames are not transmitted. Shibata discloses
2 displaying (receiving) video frames while silence (no audio) takes place. (Shibata
3 at page 597). Shibata describes that synchronization of audio and video takes
4 place at the display (client).

5 Shibata is cited for its teaching of a method whereby audio data is sent from
6 the video server to the client station only during a "talk spurt." Shibata provides
7 no assistance in light of Katseff as to the recited methodology of claim 4. Both
8 Katseff and Shibata suggest and teach that audio and video synchronization takes
9 place at the client, teaching against synchronization of frames prior to receipt by
10 the client. Accordingly, a combination of Katseff and Shibata fails to teach or
11 suggest the claimed methods. Applicants respectfully request that the §103
12 rejections of claims 4 be withdrawn.

13 Shibata is cited for its teaching of a rate control message that is sent to a
14 server. Shibata provides no assistance in light of Katseff as to the recited
15 methodology of claim 12. Accordingly, a combination of Katseff and Shibata fails
16 to teach or suggest the claimed methods. Applicants respectfully request that the
17 §103 rejection of claim 12 be withdrawn.

18 **Claim 14** in part recites "...packaging synchronized frames of data where
19 each frame includes one or more channels of data in a system in which
20 synchronized frames are transmitted by a server over a network to a client, the
21 method comprising: storing a last data value for each channel in each frame
22 transmitted over the network; ...and packaging and transmitting over the network
23 only data for channels having changed data values.

24 Further claim 14 provides for storing a last data value and transmitting data
25 only when data values have changed. Examiner points out that "Shibata teaches a

1 method whereby a rate controller periodically monitors and stores in RAM a
2 current frame rate, a number computed by frames/second." Claim 14 is concerned
3 with a present (last) data value, storing the present (last) data value, and comparing
4 the stored present (last) data value to a subsequent data value. If there is a
5 difference in stored and subsequent data values, then the subsequent data value is
6 transmitted. As Examiner has pointed out, Shibata looks at a rate change, in
7 particular a video rate change. As discussed above, current video rate is compared
8 to a predetermined rate (that does not change), and current video rate is adjusted
9 according to the difference. The rate control described in Shibata does not suggest
10 that values can be compared, and that the value (stored present data value) for
11 which subsequent data values are compared against can change.

12 Therefore, Shibata provides no assistance in light of Katseff as to the
13 recited methodology of claim 14. Accordingly, a combination of Katseff and
14 Shibata fails to teach or suggest the claimed methods. Applicants respectfully
15 request that the §103 rejection of claims 14 be withdrawn.

16 Claim 18 depends from claim 16 and hence incorporates the features of
17 claim 16. As such claim 18 requires "a data retriever for retrieving a time-based
18 data stream and a motion data stream at the server, each of the streams comprising
19 frames of data; a data stream synchronizer for buffering one of the time-based data
20 stream and the motion stream to produce two streams having synchronized frames;
21 and a packetizer for packaging synchronized frames of motion data and time-based
22 data for use at the client for playback of synchronized motion and time-based data
23 to a user."

24 Katseff does not suggest nor teach retrieving both a time-based data stream
25 and motion stream. Katseff does not suggest nor teach synchronizing frames of

1 the time-based data stream and the motion stream to produce two streams of
2 synchronized frames, by buffering one of the data streams. Katseff discloses
3 buffering, however, the buffering of audio and video frames does not produce
4 synchronized frames (Katseff at col. 8, lines 60-65). Katseff relies on a
5 mechanism at the workstation (client), not the server, to synchronize audio and
6 video frames (Katseff at col. 9, lines 1-5). Katseff is silent as to packaging
7 synchronized audio and video frames, in light of the fact that there are not
8 synchronized frames to be packaged in Katseff.

9 The Examiner presents the same arguments in rejecting claim 18, as those
10 presented in rejecting claim 14. Applicants assert the arguments in support of
11 claim 14. Further, the Examiner states that it would have been obvious to one of
12 ordinary skill in the art to modify Katseff to incorporate a storage device to hold
13 data values referring to Katseff.

14 Shibata provides no assistance in light of Katseff as to the recited
15 methodology of claim 18. Accordingly, a combination of Katseff and Shibata fails
16 to teach or suggest the claimed methods. Applicants respectfully request that the
17 §103 rejection of claim 18 be withdrawn.

18 Claim 3

19 Claim 3 is rejected under 35 U.S.C. §103 as being unpatentable over
20 Katseff as applied to claim 1, and in view of U.S. Patent No. 5,642,171 to
21 Baumgartner et al (Baumgartner).

22 **Claim 3** depends from claim 1 and hence incorporates the features of claim
23 1. As such claim 3 requires "...retrieving a time-based data stream and a motion
24 data stream at the server, each stream comprising frames of data; variably
25 buffering one of the time-based data stream and the motion stream at the server to

1 produce two streams having synchronized frames; and using the synchronized
2 frames at the client for playback of synchronized motion and time-based data to a
3 user."

4 Applicants present the arguments in support of claims 2, 4, 12, and 14 in
5 regards to Katseff.

6 Baumgartner is cited for its teaching of a method whereby a current video
7 frame number is subtracted from a current audio frame number. Baumgartner;
8 however, provides no assistance in light of Katseff as to the recited methodology
9 of claim 3. Accordingly, a combination of Katseff and Shibata fails to teach or
10 suggest the claimed methods. Applicants respectfully request that the §103
11 rejection of claim 3 be withdrawn.

12 **Claim 5 and 13**

13 Claims 5 and 13 are rejected under 35 U.S.C. §103 as being unpatentable
14 over Katseff as applied to claim 1.

15 Claims 5 and 13 depend from claim 1 and hence incorporate the features of
16 claim 1. As such claims 5 and 13 require "...retrieving a time-based data stream
17 and a motion data stream at the server, each stream comprising frames of data;
18 variably buffering one of the time-based data stream and the motion stream at the
19 server to produce two streams having synchronized frames; and using the
20 synchronized frames at the client for playback of synchronized motion and time-
21 based data to a user."

22 Applicants present the arguments in support of claims 4, 12, and 14 in
23 regards to Katseff.

1 Accordingly, Katseff fails to teach or suggest the claimed methods.
2 Applicants respectfully request that the §103 rejections of claims 5 and 13 be
3 withdrawn.

4 **Claims 6, 7, 10, 17, and 19**

5 Claims 6, 7, 10, 17, and 19 are rejected under 35 U.S.C. §103 as being
6 unpatentable over Katseff as applied to claims 1 and 16, and in further view of
7 U.S. Patent No. 9,950,202 to Durward et al (Durward).

8 Claims 6, 7, and 10 depend from claim 1 and hence incorporate the
9 features of claim 1. As such claims 6, 7, and 10 require "...retrieving a time-based
10 data stream and a motion data stream at the server, each stream comprising frames
11 of data; variably buffering one of the time-based data stream and the motion
12 stream at the server to produce two streams having synchronized frames; and using
13 the synchronized frames at the client for playback of synchronized motion and
14 time-based data to a user."

15 Applicants present the arguments in support of claims 4, 12, and 14 in
16 regards to Katseff.

17 Durward is cited for its teaching of a method whereby updated positional
18 data from a person's head position sensor is mapped and used to determine the
19 position of a virtual being defined fro that user. Durward; however, provides no
20 assistance in light of Katseff as to the recited methodology of claims 6, 7 and 10.
21 Accordingly, a combination of Katseff and Shibata fails to teach or suggest the
22 claimed methods. Applicants respectfully request that the §103 rejection of claims
23 6, 7, and 10 be withdrawn.

24 Claim 17 depends from claim 16 and hence incorporates the features of
25 claim 16. As such claim 17 requires "a data retriever for retrieving a time-based

1 data stream and a motion data stream at the server, each of the streams comprising
2 frames of data; a data stream synchronizer for buffering one of the time-based data
3 stream and the motion stream to produce two streams having synchronized frames;
4 and a packetizer for packaging synchronized frames of motion data and time-based
5 data for use at the client for playback of synchronized motion and time-based data
6 to a user."

7 Applicants present the arguments in support of claim 18 in regards to
8 Katseff.

9 Durward is cited for its teaching of a method whereby updated positional
10 data from a person's head position sensor is mapped and used to determine the
11 position of a virtual being defined fro that user. Durward; however, provides no
12 assistance in light of Katseff as to the recited methodology of claim 17.
13 Accordingly, a combination of Katseff and Shibata fails to teach or suggest the
14 claimed methods. Applicants respectfully request that the §103 rejection of claims
15 17 be withdrawn.

16 Claim 19 recites in part "a method for playing back time-based and motion
17 based data that has been synchronized comprising: mapping the motion based data
18 to control the movement of virtual figure in a scene displayed at a client; and
19 playing back in a synchronization with movement of the virtual figure the time-
20 based data."

21 As discussed, Katseff does not disclose nor teach that time-based and
22 motion based data streams be synchronized with one another prior to playback at a
23 client (workstation).

24 Durward is cited for its teaching of a method whereby updated positional
25 data from a person's head position sensor is mapped and used to determine the

1 position of a virtual being defined fro that user. Durward; however, provides no
2 assistance in light of Katseff as to the recited methodology of claim 19.
3 Accordingly, a combination of Katseff and Durward fails to teach or suggest the
4 claimed methods. Applicants respectfully request that the §103 rejection of claims
5 19 be withdrawn.

6 **Claims 8, 11**

7 Claims 8, 11 are rejected under 35 U.S.C. §103 as being unpatentable over
8 Katseff as applied to claim 1, and in further view of U.S. Patent No. 5,812,791 to
9 Wasserman et al (Wasserman).

10 Claims 8 and 11 depend from claim 1 and hence incorporate the features of
11 claim 1. As such claims 8 and 11 require "...retrieving a time-based data stream
12 and a motion data stream at the server, each stream comprising frames of data;
13 variably buffering one of the time-based data stream and the motion stream at the
14 server to produce two streams having synchronized frames; and using the
15 synchronized frames at the client for playback of synchronized motion and time-
16 based data to a user."

17 Applicants present the arguments in support of claims 2, 4, 12, and 14 in
18 regards to Katseff.

19 Wasserman is cited for its teaching of a method whereby images are
20 decompressed for the use of textures, or backgrounds with overlays of moving
21 video on the still images. Wasserman describes a time stamp which is different
22 than a descriptor packet. The time stamp in Wasserman allows video to be
23 displayed at determined 0.7 intervals. The descriptor packet of the subject
24 application provides information that is provided along with the data frames that
25

1 describe content. The content in the descriptor packet does not change, unlike the
2 video presentation in Wasserman that is expected to continually change.

3 Wasserman provides no assistance in light of Katseff as to the recited
4 methodology of claims 8 and 11. Accordingly, a combination of Katseff and
5 Wasserman fails to teach or suggest the claimed methods. Applicants respectfully
6 request that the §103 rejection of claims 8 and 11 be withdrawn.

7 **Claim 15**

8 Claim 15 is rejected under 35 U.S.C. §103 as being unpatentable over
9 Katseff and Shibata as applied to claim 14, and in further view of Wasserman.

10 Claim 15 depends from claim 14 and hence incorporates the features of
11 claim 14. As such claim 15 requires "packaging synchronized frames of data
12 where each frame includes one or more channels of data in a system in which
13 synchronized frames are transmitted by a server over a network to a client, the
14 method comprising: storing a last data value for each channel in each frame
15 transmitted over the network; ...and packaging and transmitting over the network
16 only data for channels having changed data values."

17 Applicants present the arguments made in support of claim 14 in regards to
18 Katseff.

19 Wasserman provides no assistance in light of Katseff and Shibata as to the
20 recited methodology of claim 15. Accordingly, a combination of Katseff, Shibata,
21 and Wasserman fails to teach or suggest the claimed methods. Applicants
22 respectfully request that the §103 rejection of claims 15 be withdrawn.

23 **Claim 20**

24 Claim 20 is rejected under 35 U.S.C. §103 as being unpatentable over
25 Katseff and Durward as applied to claims 10 and 17 above, and in further view of

1 Baumgartner. Examiner points out that claim 20 incorporates substantially similar
2 subject matter as claimed in claims 1, 10, 16, and 17. Claim 20 is rejected by the
3 same arguments presented in rejecting claims 1, 10, 16, and 17.

4 Applicants reassert the arguments presented in support of claims 1, 10, 16,
5 and 17 in traversing Examiner's rejection of claim 20. Applicants respectfully
6 request that the §103 rejection of claims 20 be withdrawn.

7
8 **CONCLUSION**

9 All pending claims 1, 3-20 are in condition for allowance. Applicant
10 respectfully requests reconsideration and prompt issuance of the subject
11 application. If any issues remain that prevent issuance of this application, the
12 Examiner is urged to contact the undersigned attorney before issuing a subsequent
13 Action.

14
15 Respectfully Submitted,
